SPIRIT LEVELING IN OHIO, 1898 TO 1916, INCLUSIVE.

R. B. MARSHALL, Chief Geographer.

INTRODUCTION.

Cooperation.—The State of Ohio contributed financially to the work in the State during the years 1900 to 1915, inclusive, and was represented by C. N. Brown, inspector, in 1901-2 and by C. E. Sherman, inspector, from 1902 to 1916.

Previous publication.—All results of spirit leveling in Ohio previously published by the United States Geological Survey in Bulletins 411, 476, and 518 and all the results of later work are included in this report. All elevations are in agreement with the 1907 adjustment of precise leveling and were not changed by the 1912 adjustment.

Primary or precise leveling has been extended over the entire State; every quadrangle and every county has several bench marks well distributed within its area. The bench marks are grouped by quadrangles, arranged alphabetically.

Personnel.—The field work during 1898 to 1902, inclusive, was done under the direction of H. M. Wilson and J. H. Renshaw, geographers in charge of eastern and central divisions of topography, respectively, Ohio being then apportioned half to each; that during 1903 to 1906, inclusive, was done under H. M. Wilson, geographer; that during 1907 was done under Frank Sutton, geographer; and that since 1907 was done under W. H. Herron, geographer. The work since January, 1908, was done under the general direction of R. B. Marshall, chief geographer. The names of the respective levelmen are given in the introductions to the several lists. The office work of computation, adjustment, and preparation of lists was done mainly by S. S. Gannett, geographer, under the general direction of E. M. Douglas, geographer.

Classification.—The elevations are classified as precise or primary, according to the methods employed in their determination. For precise-level lines instruments and rods of the highest grade are used, each line is run both forward and backward, and every precaution is taken to guard against error. The allowable divergence be-

tween the forward and the backward lines in feet is represented by the formula $0.017 \sqrt{D}$, in which D is the distance in miles between bench marks. For primary lines standard Y levels are used; lines are run in circuits or are closed on precise lines, with an allowable closing error in feet represented by $0.05 \sqrt{D}$, in which D is the length of the circuit in miles, sufficient care being given to the work to maintain this standard. For levels of both classes careful office adjustments are made, the small outstanding errors being distributed over the lines.

Bench marks.—The standard bench marks are of two forms. The first form is a circular bronze or aluminum tablet (C and E , Pl. II), $3\frac{1}{2}$ inches in diameter and one-quarter inch thick, having a 3-inch stem, which is cemented in a drill hole in solid rock in the wall of some public building, a bridge abutment, or other substantial masonry structure. The second form (F , Pl. II), used where masonry or rock is not available, consists of a hollow wrought-iron post $3\frac{1}{2}$ inches in outer diameter and 4 feet in length, which is set about 3 feet in the ground. The bottom is spread out to a width of 10 inches in order to give a firm bearing on the earth. A bronze or aluminum-bronze cap is riveted upon the top of the post. A third style of bench mark with abbreviated lettering (B and D , Pl. II) is used for unimportant points. This consists of a special copper nail $1\frac{1}{2}$ inches in length driven through a copper washer seven-eighths inch in diameter. The tablets as well as the caps on the iron posts are appropriately lettered, and where States have cooperated in the work the fact of such co-operation is indicated by the addition of the State name (G , Pl. II). A third form consists of a copper bolt 1 inch in diameter and 4 inches long, which is split at one end and expanded in a drill hole in masonry by driving on a brass wedge. But few of this class have been used in Ohio, and their use has now been discontinued.

The numbers stamped on the bench marks described in the following pages represent the elevations to the nearest foot as determined by the levelman. These numbers are stamped with $\frac{3}{16}$ -inch steel dies on the tablets or post caps to the left of the word "feet." The office adjustment of the notes and the reduction to mean sea level datum may so change some of the figures that the original markings are 1 or 2 feet in error. It is assumed that engineers and others who have occasion to use the bench-mark elevations will apply to the Director of the United States Geological Survey, at Washington, D. C., for the adjusted values, and will use the markings as identification numbers only.

Datum.—All elevations determined by the United States Geological Survey and United States Coast and Geodetic Survey are referred to mean sea level, which is the level that the sea would assume if the influence of winds and tides were eliminated. This level is not the

elevation determined from the mean of the highest and the lowest tides, nor is it the half sum of the mean of all the high tides and the mean of all the low tides, which is called the half-tide level. *Mean sea level is the average height of the water, all stages of the tide being considered.* It is determined from observations made by means of tidal gages placed at stations where local conditions, such as long, narrow bays, rivers, and like features, will not affect the height of the water. To obtain even approximately correct results these observations must extend over at least one lunar month, and if accuracy is desired they must extend over several years. At ocean stations the half-tide level and the mean sea level usually differ but little. It is assumed that there is no difference between the mean sea levels determined from observations in the Atlantic Ocean, the Gulf of Mexico, and the Pacific Ocean.

The connection with tidal stations for bench marks in certain areas that lie at some distance from the seacoast is still uncertain, and this fact is indicated by the addition of a letter or word to the right of the word "Datum" on tablets or posts. For such areas corrections for published results will be made from time to time as the precise-level lines of the United States Geological Survey, the United States Coast and Geodetic Survey, or other Government organizations are extended. The precise-level net in Ohio is composed of the Coast and Geodetic Survey lines from Belpre west via Cincinnati to the State line, from Toledo south to Cincinnati, from Deshler to Chicago Junction, and from Alliance to Youngstown; the Army Engineers' lines along Ohio and Muskingum rivers; the Baltimore & Ohio Railroad lines from near Lowellville to Chicago Junction and from Warwick to Wheeling; the Pittsburgh, Fort Wayne & Chicago Railroad line from East Palestine to Massillon; and lines run by the United States Geological Survey, record of which is given in this bulletin, from Cleveland to Canton, from Ottawa via Roselm and Evansport to Haskins, from Chillicothe to Portsmouth, from Chillicothe to Columbus, and from Columbus to Uhrichsville and Station Fifteen. In the adjustment made by the Coast and Geodetic Survey the weights assigned to the various links of the net were dependent on their length, the method of leveling used, and the comparative results. The recent precise leveling by the Coast and Geodetic Survey, and by the Geological Survey, received the greatest weight and were very little distorted by adjustment, but the railroad lines were considerably altered. The best theoretical value for the junction-point elevations were in most cases not actually adopted, the heights by the 1903 adjustment being allowed to stand where the difference was within the range of uncertainty, thus making less correction to lists already prepared and published. Thus the former elevations on lines from Toledo to Cincinnati, and from Cleveland

to Canton, are retained by the Coast and Geodetic Survey as the adopted elevations by the 1912 adjustment. The elevations adopted in this bulletin for Uhrichsville and points thence to Massillon, Zanesville, and Wheeling differ also from those adopted by the Coast and Geodetic Survey, the result of an easement made to give greater weight to the Baltimore and Ohio Railroad line between Uhrichsville and Wheeling, which was checked by primary circuits of 1908.

Topographic maps.—All of the quadrangles for which leveling data are given in this publication have been surveyed and the resulting topographic maps have been published or soon will be published by the United States Geological Survey.

These maps may be obtained for 10 cents each or \$3 for 50, except the Cincinnati double sheet, which is 20 cents, on application to the Director of the Survey at Washington, D. C.

PRECISE AND PRIMARY LEVELING.

AKRON QUADRANGLE.

Precise leveling by Baltimore & Ohio R. R.

From Akron southwest to Barberton.

Akron, Summit County, 600 feet east of Union Station, in east end of retaining wall on north side of tracks; copper bolt (B. & O. b. m. 441)	Feet. 1,009.189
Akron, 1 mile southwest of Union Station, in southwest end of northwest coping of culvert along Cleveland, Akron & Columbus Ry. tracks; copper bolt (B. & O. b. m. 442)	993.911
Akron, 3.5 miles southwest of, on Cleveland, Akron & Columbus Ry. bridge over old canal; copper bolt (B. & O. b. m. 443)	976.936
Barberton station; southeast corner of stone doorsill at entrance to ladies' waiting room (B. & O. b. m. 441)	968.109

Primary leveling by W. E. Earle in 1903 and E. I. Shea in 1903.

From Hudson west along highway to Peninsula, thence south via Everett to Akron.

Peninsula, in northwest corner of city hall; aluminum tablet stamped "711 Cleveland"	711.167
Everett, east side of canal lock, on third stone from south gate; chiseled cross	719.97
Ira station, iron bridge over Cuyahoga River, northwest stone pillar, in top stone; chiseled cross	729.722
Botzum, in northeast stone abutment of bridge over Ohio Canal; aluminum tablet stamped "753 Cleveland"	752.890
Cranmer flag station, 1,000 feet north of, southeast stone abutment of road bridge over canal, on second step from bottom; chiseled cross	765.99
Akron, 1.5 miles north of, fifth canal lock north of West North Street, in northeast corner of stone wall; chiseled cross	787.90
Akron, 175 feet west of Howard Street station, iron bridge of Cleveland, Terminal & Valley R. R. over Howard Street, in southeast stone abutment; chiseled cross	884.62

From Akron west along highway via Copley to Sharon Center, thence north to West Richfield, thence east to Peninsula.

Copley, 1.5 miles east of, iron bridge over Pigeon Creek, Northern Ohio Ry., 20 feet east of crossroad, southeast corner of stone abutment; chiseled cross	Feet. 976.59
Copley, in southwest corner of Disciples Church; aluminum tablet stamped "1049 Cleveland"	1,049.163
Copley, 1.3 miles west of, in northwest corner of road forks, 75 feet east of road crossing north and south, at house of E. Bigelow, in south top stone to small culvert; chiseled cross	1,081.76
Copley, 2.3 miles west of, at southeast corner of J. M. Andrews house, northwest corner of forks of road on Medina-Summit county line, in large top stone of culvert; cut	1,044.03
Sharon Center, 1 mile east of, Sharon Township, east side of road, southwest corner of foundation of barn owned by Jennie Hollinger; aluminum tablet stamped "1044 Cleveland"	1,043.707
Granger, 1.25 miles east of, Granger Township, southeast corner of forks of roads, in south side of top stone of stone culvert; aluminum tablet stamped "1072 Cleveland"	1,072.311
Richfield, 1 mile south of, west side of road, 1,100 feet north of forks of Medino-Brecksville road, top of culvert; chiseled cross	1,224.20
West Richfield, in southeast corner of Carter House; aluminum tablet stamped "1279 Cleveland"	1,279.027
Peninsula, 2 miles west of, south side of road, at forks east, west, and northeast, in top stone to culvert; chiseled cross	1,096.37

From East Akron southwest along highway to Barberton, thence west along Erie R. R. to Wadsworth, thence north along highway to Sharon Center.

Akron, northeast corner of east porch of county jail; aluminum tablet stamped "1027 Cleveland" (on checked spur line)	1,027.182
Barberton, 1.5 miles north of, in southeast corner of stone bridge with iron hand rails over drain east of Lawndale; chiseled cross	965.61
Barberton, at right side of main entrance stairway of Barberton Inn, in face of support to veranda; aluminum tablet stamped "981 Cleveland" (probably destroyed, 1915)	981.269
Barberton, 1.5 miles west of station, Erie Railroad milestone 210; cross chiseled on top	1,012.70
Sherman, 35 feet east of Erie Railroad station, in top of milestone 212; bronze tablet stamped "1085 Cleveland"	1,085.476
Wadsworth, Wadsworth National Bank, 1 foot south of doorway, in face of foundation stone; bronze tablet stamped "1170 Cleveland"	1,170.404
Wadsworth, 4 miles north of, at southeast corner of crossroads, in top of large stone post; chiseled cross	1,089.27
Sharon Center, Sharon Township, at southwest corner of Universalist Church, in face of stone foundation; bronze tablet stamped "1128 Cleveland"	1,127.748

ALGER QUADRANGLE.
